B: CONFIGURATION CHOICES

A working vocabulary of digital twin configurations

Six families of descriptors; neither sequential stages nor mutually exclusive classes.

HOW TO READ THE CONNECTIONS

Curves enumerate candidate pairings between neighbouring columns for visual exploration only.
They do not encode execution order, proven compatibility, empirical frequency or a complete dependency graph.

*** Cross-cutting configuration descriptors.**

Separate model basis from scale; data direction from authority and feedback; agent roles from simulation models.
Separate timing guarantees, update triggers and rates. One-way is a Digital Shadow in Kritzinger et al. (2018).
Dashed borders: proposed extensions of the source-supported vocabulary.

The six-family arrangement is proposed synthesis. References support terms or examples, not every connecting curve.
