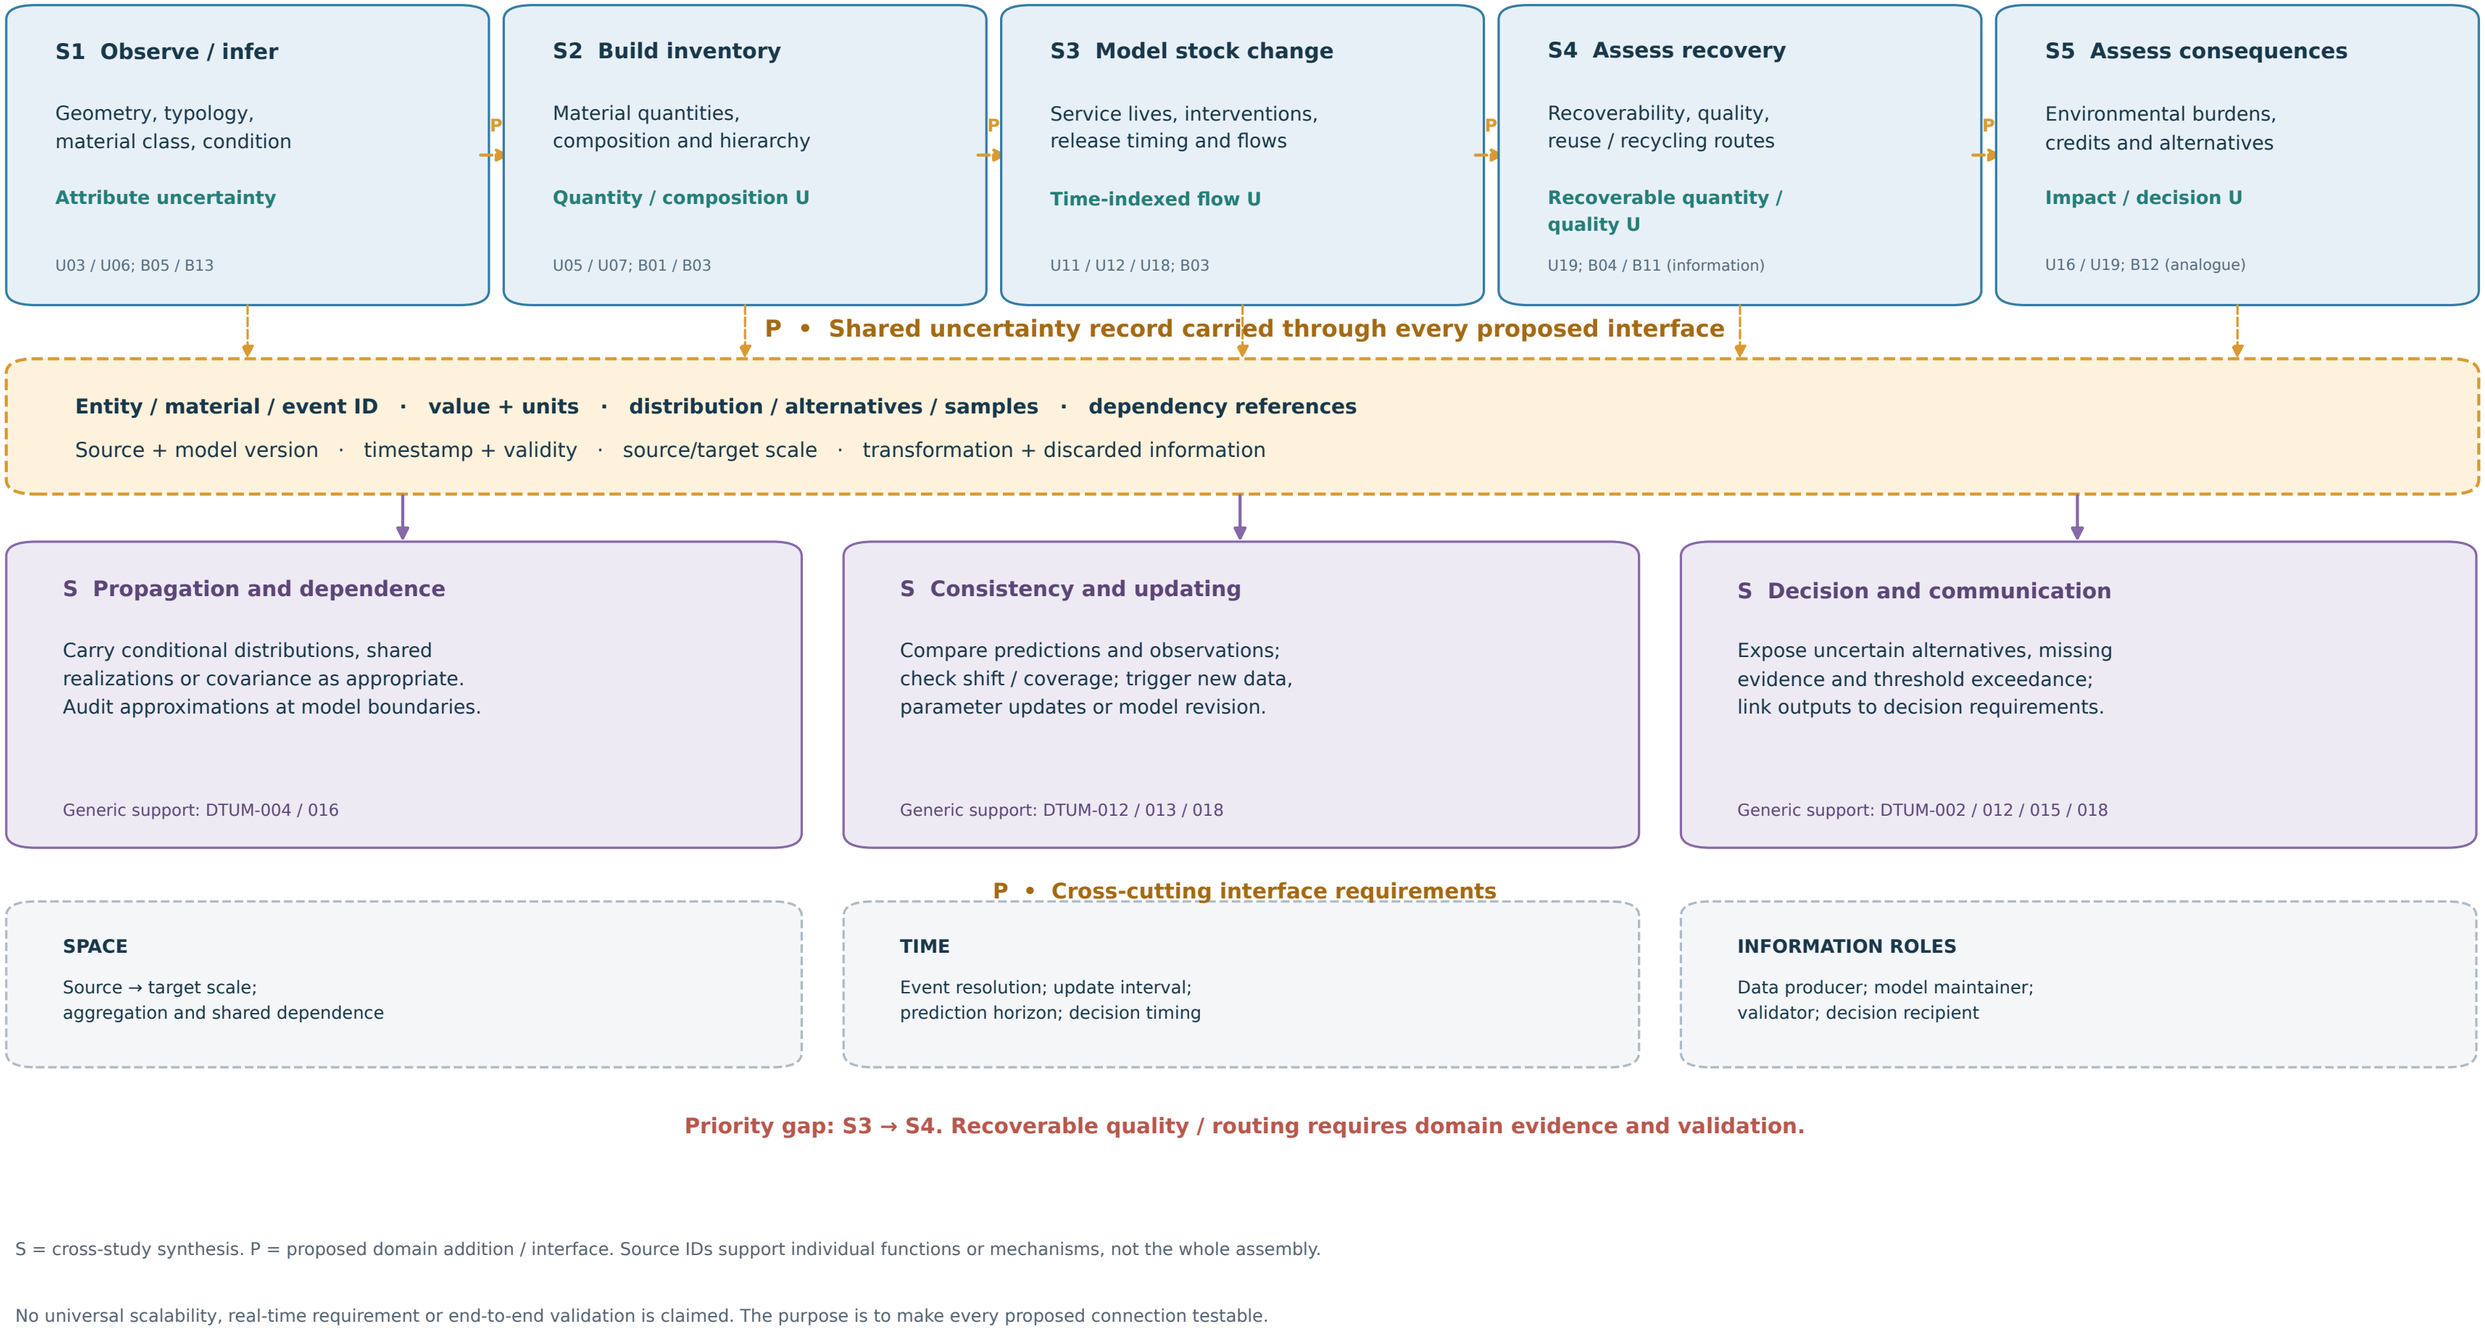
06 A synthesized architecture for uncertainty continuity

Material-flow functions are evidence-informed. The integrated architecture and its uncertainty-carrying interfaces are proposals for evaluation.



Priority gap: S3 → S4. Recoverable quality / routing requires domain evidence and validation.

S = cross-study synthesis. P = proposed domain addition / interface. Source IDs support individual functions or mechanisms, not the whole assembly.

No universal scalability, real-time requirement or end-to-end validation is claimed. The purpose is to make every proposed connection testable.
