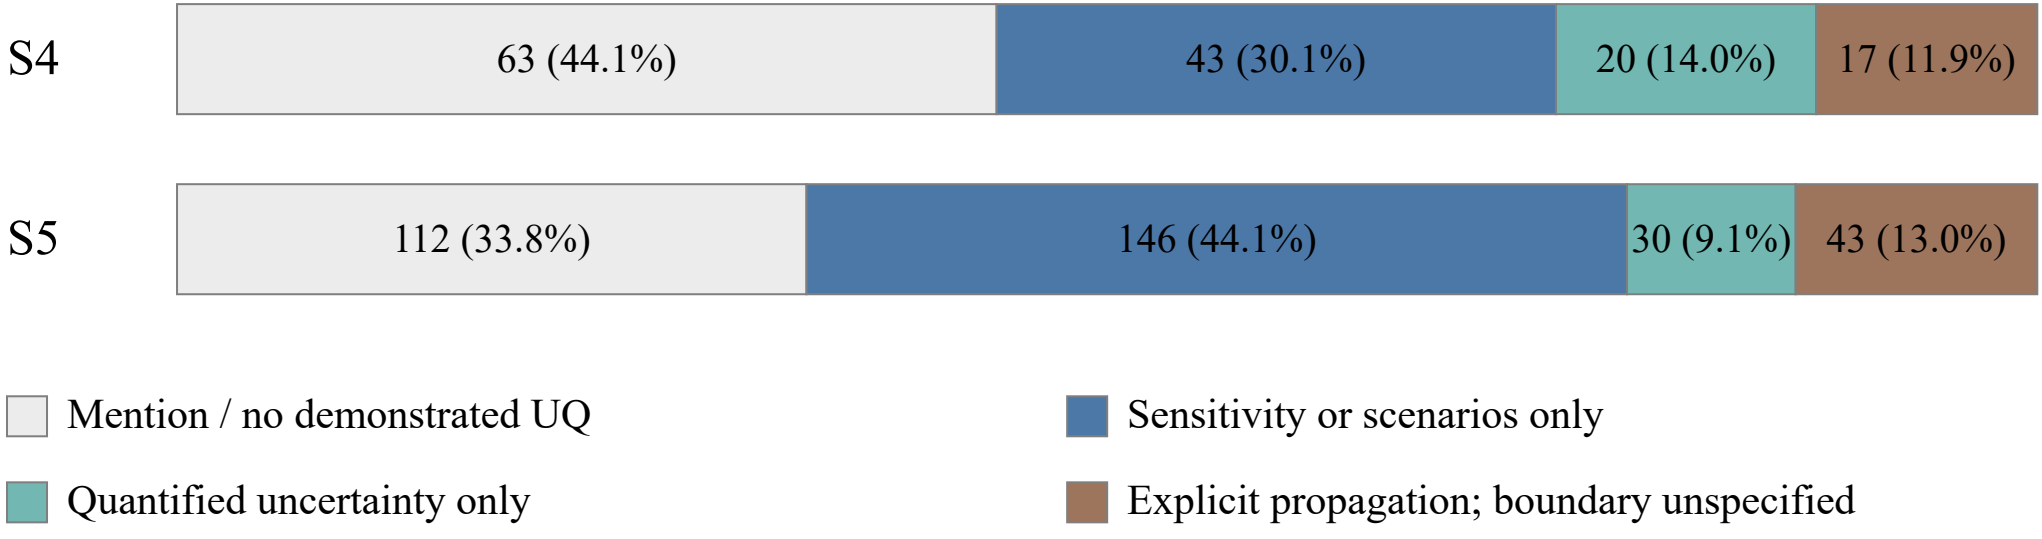
Uncertainty treatment among assessed U-layer candidates

Title/abstract evidence: S4 n = 143; S5 n = 331; union n = 392 (82 overlap).



Explicit cross-stage screening claims: S4 1/143 (0.7%); S5 3/331 (0.9%).

Full-text appraisal of the three distinct cross-stage candidates:
1 partial S4→S5 case + 2 other-input→S5 cases

Propagation within a model does not establish transfer across S boundaries.
These selected-candidate percentages are not prevalence estimates for all Base publications.
